

How To Install a CO₂ Cylinder on a Culligan Quench Sparkling Dispenser

Thank you for being a Culligan Quench customer! We are excited for your workplace to experience the great-tasting sparkling water from your new Culligan Quench machine. Please take the steps below to install your CO₂ cylinder so your employees, customers, and guests can enjoy crisp, refreshing sparkling water.

Supplies

- CO₂ Cylinder
- Adjustable wrench or CO₂ wrench
- Large pitcher or bucket

Instructions

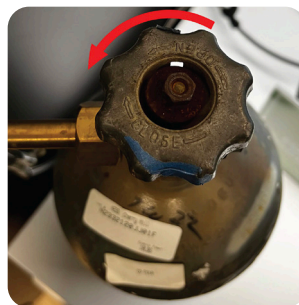

Step 1. Secure the regulator to the tank using an adjustable wrench or CO₂ wrench. Be sure to tighten until the Hex Nut does not move.

Step 2. Twist the pressure release knob to the left to open the CO₂ connection to the Culligan Quench machine. Ensure the pressure is set to the pre-indicated pressure mark on the gauge. To adjust the pressure, please pull out the knob and twist clockwise for more pressure or counterclockwise for less.

Step 3. Flush your Culligan Quench machine by dispensing 1- 2 liters of sparkling water. Note when adjusting the pressure after initial pressurization, please be sure to flush about 1 liter of sparkling water through the machine to receive the proper sparkling mix.
